

Math Conventions

focus on what might seem different

Operator precedence:

- `:: $ []` PEU: `%x%` (MD)(AS) and L-to-R associativity
“`1:5 * 2`” : has precedence
- `! (& &&) (| ||)` xor
- `&` vectorized;
`&&` single-valued, efficient

`1:5 * 2` # `1:10` or `2,4,6...`?

[1] 2 4 6 8 10

T | F & F # `&` has priority

[1] TRUE

Operators to note:

exponentiation: `^` (accepts `**`)
